

# Message Passing Programming

//Advanced Use of Collectives

## // The Problem

- Given a  $M \times N$  matrix, we want to calculate the sum of each row and each column
- Results are  $M$  values (row sums) and  $N$  values (column sums)

// Pseudocode

loop over  $i = 1, M; j = 1, N$

–  $rowsum_i = rowsum_i + matrix_{i,j}$

–  $columnsum_j = columnsum_j + matrix_{i,j}$

end loop

# // MPI Implementation

- Matrix is decomposed across procs over one of its dims (Scenario A)
- Matrix is decomposed across procs over both of its dims (Scenario B)

0	0	1	2	3
1	4	5	6	7
2	8	9	10	11
3	12	13	14	15

0				1				2				3			
0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15

0	1	2	3
4	5	6	7
8	9	10	11
12	13	14	15

0				1				2				3			
0	4	8	12	1	5	9	13	2	6	10	14	3	7	11	15

## // Scenario A approach (meh)

- Create **Communicator** across all processes (root)
- **Scatter** data based on decomposition (row-wise or column-wise)
- Each process calculates sum locally (row or column)
- Root **gathers** sums
- Root **Reduces** on every array position

## // Scenario B approach (👍)

- Create **Communicator** across all processes (root)
- **Scatter** array decomposed on first of two dims
- Each process calculates the sum locally
- Root **collects** sums
- Communicator **scatters** array decomposed on second dim
- Each process calculates the sum locally
- Root **gathers** sums
